PLANTES DES MONTAGNES ET DES ROCHERS

FOUGÈRES et ORCHIDÉES RUSTIOUES

Leur culture dans les jardins

PAR

H. CORREVON

Un volume illustré in-12

Honoré de la médaille d'or de la Société nationale d'Horticulture de France et de plusieurs prix d'honneur aux expositions d'horticulture.

Le Guide pratique de l'amateur de plantes alpines

A la demande, fréquemment renouvelée, de rééditer plusieurs de ses ouvrages sur les plantes (dont dix-huit sont entièrement épuisés à l'heure actuelle), M. H. Correvon a répondu par un nouveau travail, beaucoup plus considérable que tous les autres et qui peut être considéré comme les résumant tous. C'est un gros volume in 12, de 491 pages, illustré par M. Fernand Correvon et dont voici la table des matières:

Préface.

- Chap. - Les plantes dans les montagnes. Leur caractère particulier; leur nature; leurs conditions d'existence.
 - II. Acclimatation, semis et culture de plantes de montagnes.
 III. Cultures spéciales. Cultures dans le sphagnum, en terrines,
 - en baquets; la tourbière et la moraine.
 - Les plantes silicoles ou calcifuges, par le Dr Rosensthiel. IV.
 - V. Les plantes saxatiles et murales; les murs fleuris. VI. — Construction des rocailles.
 - VII. Jardins alpins et jardins botaniques alpins.
 - VIII. Liste des plantes de montagnes cultivées dans les jardins. Leur indigénat, l'époque de leur floraison, leur description sommaire, avec indication de la culture convenant à chacune d'elles. IX. — Floraire. L'ombrosum; toit fleuri; gazons fleuris; cultures
 - sur radeau.

 - X. La fougeraie.
 XI. Les orchidées de pleine terre.
 - XII. Cactées rustiques. 1) XIII. — Les lys.))
 - XIV. La « Florarina » (voir Notice: bas de la page 5).

Index alphabétique des genres du chapitre VIII. Index des chapitres X, XI, XII et XIII.

Index des noms français.

Ce volume est en vente chez l'auteur, à « Floraire », au prix de 10 francs, port en sus. - Il a été traduit en danois et en anglais.

NOTICES

To our new customers:

The Floraire work of acclimatization of the alpine flora in gardens was started in 1875 by Mr. Henry Correvon in the old family garden at Yverdon (Vaud). This was founded in 1828 (a century ago) as a garden establishment by Mr. J. Züttel, grandfather of Mr. H. Correvon, and moved to Geneva in 1879. We have been growing a large collection of mountain plants and others, supplying both seeds and plants to botanists and garden lovers in all parts of the world. Experimental stations in the Jura mountains and the Alps, as well as the very large Floraire gardens near Geneva, enable us to collect seeds of even the rarest plants, in sufficient quantities to insure their being fresh — fresh seeds germinating much quicker and more surely than old ones. Our service is prompt and reliable, and our seeds are always true to name.

Our garden at Floraire is open to the public every day but Sunday. The one we have in the Jura at St. Cergue near the Chalet-crèmerie "La Chèvrerie" (line of railway Nyon-St. Cergues) is open to visitors

from May to October.

We publish yearly an exhaustive list of alpine and bog plants, perenials, hardy orchids, ferns and cacti. Collectors will be especially interested in our lists of Androsace, Gentiana, Primula, Saxifraga, Sedum and Semperviyum, of which we have the larges known collections.

All our seeds are certain to germinate if cultural directions given below be followed. Please remember, that many species are of slow germination.

Packets of these are marked with a cross (\times).

Our seeds are our own crop or have been collected on the mountains by our own people or in our gardens there.

Collections: Some owners of Rockgardens do not know our latin and technical names of plants and find some difficulty in making their choice.

For those who prefer to leave the choice of their seeds to us, we make up collections for the following locations:

Rock and alpine gardens, Alpine meadows, Woodlands, Barren Slopes, Walls, Bogs, Borders, Clay, limestone or peat soils, Carpeting plants, Aromatic plants, Melliferous plants (for the bees), Medicinal plants, Flowers for cutting, Perennials for gardens.

We allways do our best in order to help amateurs to succeed with their sowings. In order to get the right species please tell us the position of the garden or of the wall or rockery, nature of soil (peat or lime), if wet or dry, etc. We know the climatical conditions which exist in England and in U. S. A. and we therefore are able to choose accordingly.

PRICES OF COLLECTIONS - OUR OWN SELECTION

							In America:	In Englan	d:
10	best	kinds	for				\$1.00	4/.	
50 50))))))				$\begin{bmatrix} \$2.00 \\ \$5.00 \end{bmatrix}$ Postpaid	$\frac{8}{20}$.	Postpaid

As we are anxious to furnish the right seeds for the right location, please give us an idea of the climate, altitude, exposure, and other conditions.

People everywhere are coming to realise more and more the joy that lovely mountain plants can give to those who grow them. They are easier to grow than is generally supposed, if just a little more than ordinary care is given to them. We want to help you to know them if you do not already. If you have no rock garden, you can grow them in walls, crevices of rocks, between stone steps or flagstones. Some of them make charming and neat edgings for the garden borders.

Prices of single packet.

All packets of seeds are 20 cents each in the U.S.A. and 10d. in England. They are good sized packets, but rarer plants have fewer seeds in them.

Terms.

All orders must be accompanied by remittance. Payment may be made by draft on a bank, by American or English banknotes sent by registered mail, or international Post Money Orders. Stamps cannot be accepted.

Seed orders amounting to more than \$2 (or eight shillings) are sent postpaid.

IMPORTANT:

Write your name and address clearly and fully on every order and letter. We frequently receive orders with unreadable or incomplete addresses which we therefore cannot fill.

In ordering seeds please add a few supplementary names in case any of the desired kinds are already exhausted.

INSTRUCTIONS FOR SOWING

The majority of our seeds, especially those for perennial border plants, can be treated just like cabbage or carrot seeds. However, the seeds of more difficult species and of true alpines require a little more care.

- The Soil. Prepare a light candy soil with just enough nourishment for the growth of very young plants. For most seeds, use one third peat, humus, or leaf mould, one third good loam, and one third sand (granitic or calcareous according to the chemical affinity of the species). Mix thoroughly and sift.
- Small Seeds. For very small seeds, like Saxifraga, Sedum, Sempervivum, etc. use one half humus and one half sand. These must be barely covered with soil, or just pressed in with a board, and care must be taken not to wash them away when watering.
- The Seed Bed. Sow in pots, pans, or boxes, with a layer of gravel or small stones at the bottom to insure perfect drainage. Keep these in a cold frame (not a hotbed) or in any cool and partially shaded place.

 Keep moist all the time and as evenly as possible.
- Warm Climates. For continental and dry climates, it is advisable to place a layer of sphagnum moss just above the gravel at the bottom of the pan or box. This helps to regulate the moisture. In southern climates it should also be mixed with the soil (sifted or broken up) in p ace of the humus.
- Time of Sowing. The best time to sow alpines is the very late autumn (just before frost) or early spring. Where it is possible, cover the beds with snow for a week or two and expose to the heat suddenly. The action of the snow hastens germination to an extraordinary degree.
- Transplanting. It is better not to sow directly in the rock garden or in the beds although this can be done in cases of naturalization in walls, woodlands, or fields. The seedlings should be transplanted once before being put in their definite places.
- For more details see: "Les Plantes des Montagnes et des Rochers, leur culture et leur acclimatation dans les jardins" by H. CORREVON, in which the special need, manner or growth and location are given for each plant. This book has been translated into English and will be distributed this spring through the publisher Mac-Millan in N. Y. and London. It can be bought in our offices at Floraire.

ROCK GARDENING

Rock and Alpine plants are nowadays grown in most of the private and public gardens in the towns throughout the United Kingdom as well as the United States of America, Canada and other English-speaking countries. On the continent this is not so universal but their popularity increases constantly especially in the Northern countries.

The wide-spread enthusiasm for alpine flowers and rock gardens which I found during my recent visit to the United States surprised and delighted me.

In this connection I can not refrain from quoting a sympathetic note on the subject, which has appeared in an American Medical journal 1:

"The building of the rock garden in itself makes demands upon special faculties. A knowledge of the primary laws governing the growth of rock plants as to their individual soil preferences—calcophiles or calcophobes—is necessary; to the arrangement of soil and rocks with reference or drainage and aesthetic effects is an art of no mean value; and above all the ability to make plants look natural and happy in an artificial reproduction of their environment may be either inborn or ultimately acquired after much experience of trial and failure. With some individuals it is a primal instinct. The collection of new varieties means an increased interest in botany and floriculture, and in the geographical distribution of plants. As one grows in grace and in knowledge the creative desire develops, and the rock-gardener turns to the thrilling possibilities of selection and hybridisation. A new passion is born out of the old, and the remaining years of life are all too few for the sowing of seeds produced by crossing and the determination of the results. And should a worthy new variety result—well, it is a victory worth a whole lifetime of effort. In this ultimate phase of the sport of gardening the highest thrills of a gambling game may be experienced. Finally, the literature of rockgardening offers an abundant library, for winter and in-bed reading. The stories of plant collecting in the distant and out-of-the-way places of the world are as thrilling to the rock gardener as big game stories are to the hunter.

to the hunter.

"Perhaps an exclamation of the perennial youth of the man who preaches the culture of alpine plants can be found in his lifelong interest in alpine gardening. There are many other accounts of individual experiences in rockgardening that may be added to this library of literature on this subject, but they will ultimately be discovered by the adventure in this field. We have mentioned rockgardening first in our contemplated category of recreations for physicians, because it seems to us to combine all the essential features of a perfect hobby; its satisfaction to the creative and inquiring mind, the pursuit of scientific knowledge, aesthetic appreciation. These interests, so manifold and varied, constitute a field so limitless in extent that all of the spare time of one's whole life might be expended in it without any possibility of exhausting its possibilities. Its cerebral atimuli are so different from those of the practice of medicine that frequent reaction to them, if only for a relatively short time, leads to that more perfect mental catharsis which is the aim of all forms of recreation."

We think this experience of an American author who is a teacher of medicine is an eloquent encouragement for alpine gardeners.

We may add that for the culture of alpine and mountain plants it is not necessary to build rockeries and that a large part of them succeed well in a light soil as edgings. Old walls and especially retaining walls offer the best opportunities for rockplants and especially for the dwarf and creeping ones. The walls we have planted at "Floraire" are most admired by the visitors of our gardens. The sign /// is given in our catalogues for those plants which can be grown in walls.

¹ Annals of Clinical Medicine, Baltimore, 1927, V. Sept.

Rock garden and alpineplants (the culture of mountain plants) by HENRY CORREVON

A practical Guide for Rock and Alpine Gardens.

The French edition of this book has been so popular that it has been sent all over the world and was rapidly exhausted. Although a Danish edition has been published and an Ungarian one is to be sent out, we have not yet given an English one. For years this has been asked for and we have now translated the most important chapters and altered and increased those which are of special interest to English and American Alpine gardeners. The book is now brought up-to-date and with its illustrations it will provide a practical and reliable guide. It shall be published in New York and London by the well known MacMillan publishing Co. The subscribers shall get it as soon as ready directly from the publishers or from Floraire.

PLAN OF THE BOOK

INTRODUCTION. — I. — Rockgardening in England and in U.S.A. II. — Mountain plants, their nature and the conditions of their existence. III. — Acclimatisation and culture of Mountain plants; transplanting from nature; sowing seeds, etc. IV. — The culture of various species. V. — Plants of the lime and plants of the granite. VI. — Special cultures: alpine plants grown in sphagnum, in pan and in the "tourbière" or moraine. VII. — The wall garden. VIII. — The rockery. IX. — Alpine Gardens in the Mountains; protection of the wild flora, the Garden establishment "FLORAIRE". X. — The Fernery. XI. — The terrestrail Orchids. XII. — Hardy Cacti. XIII. — Enumeration of the plants for the rockery, the wall or the alpine garden in the cold and temperate regions, a list with short description of everyone, culture and origine.

People who already subscribed here as well as those who paid it in advance shall get the book directly sent from New York..

The illustrations are carefully choose so as to make of this English edition truly a "Bible of the Alpine Gardener" as friends in England have styled it in its French garb.

The book is promised for March; apply to the MacMillan Co., 60, Fifth Avenue, New York and London; also here to Floraire.

H. C.

Announced for £1 (\$5) but the price is still uncertain.

EXPLICATION DES SIGNES EXPLANATION OF THE MARKS IN THE SEEDLIST

Ab = Plantes pour abeilles. — For bees.

Aq Plantes aquatiques. — Water plants.

Ar = Plantes propres à être naturalisées sur les pentes sèches et arides.

To naturalise on dry slopes and barren places.

Arom. = Aromatiques. - Aromatics.

Arb = Arbustes pour rocailles. - Rockery shrubs.

Arbr = Arbres. — Trees.

Bord = Plantes à bordure. — Dwarf and creeping, good for the edging of borders.

Env = Plantes envahissantes. — Underground creeping; invading.

Gr = Plantes grimpantes. — Climbers.

H = Humidité. — Dampness.

Med = Plantes médicinales. — Medicinal plants.

N = Nord. — Northern exposure.

O = Plante d'ombre. — Plants for shade.

½ O = Mi-ombre. — Half shade.

Pal = Paludéennes. — Bogplants.

Pr = Propres à émailler la prairie. — For the "Swiss meadow".

 ${f R}$ = Plantes de rochers sans exigences spéciales. — Easy grown rock plants.

S = Plantes spéciales pour soleil. — Sun-loving plants. Sp = Culture dans le Sphagnum. — Sphagnum culture.

T = Tourbière. — English « moraine ».

V = Plantes vivaces. — Perennial border plants.

Tap = Tapissantes. — Creeping for paved walks.

= Espèce de culture spéciale. — Special treatment.

A = Plantes délicates, à protéger l'hiver (sous climat Genève). → To be protected in winter (Geneva climate).

/// = Plantes saxatiles propres à planter dans les murs. — Plants for the Wallgarden.

+ = Meilleures espèces pour longue floraison et fleur coupée. — Best flowers for cutting.

• Annuelle. — Annual.

of = Bisannuelle. — Biennial.

 $\mathbf{N.~B.}$.— Nous marquons généralement d'un \times sur leur paquet les espèces de germination lente.

We generally put an \times on the packets of the species of slow germination.

l Ces Opuntia sont des Cactées dont les graines l'évent facilement et qui sont rustiques à nos hivers. Il suffit, dans les pays du Nord, de tenir les plantes au sec (recouvertes de planches inclinées) pendant la mauvaise saison.

These Opuntias can be raised easily from seed. The are hardy in Northern Europe if kept dry trough the winter.

We have this year been able to collect seeds of some fine conifers and other things which we offer here either by packets or by the weight: The Silk tree of Constantinople (Mimosa Julibrissin) with nice fragrant pink flowers for sheltered places. 10 gr. 2.50.

Cedrus atlantica glauca (the big blue tree at the entrance of Floraire)

10 grammes 2 fr. 50.

Italian Cypress the true, very strait and narrow, collected on the Lago

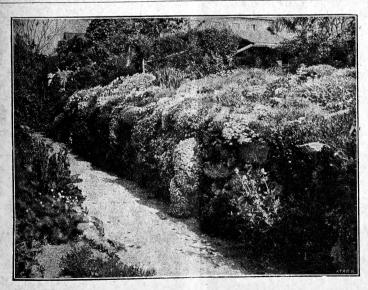

di Garda: 10 gr. 2 fr. 50.

The Box (Buxus sempervivens) of the dry limestone hills. 10 gr. 2.50. Cypress of Arizona var. glabra sent us in 1901 by President Roosevelt from his own garden at Oyster Bay. 10 gr. 2 fr. 50.

The Pomegranete tree (Punica Granatum); hardy form; recolted here. Seeds for the swiss meadow: Colchics, Wild Crocus, Primroses, etc., to

enrich the grass. 10 gr. 2 fr. 50.

Floraire grass (gazon Floraire) a mixture of meadow seeds for making the swiss meadow (Campanulas Aquilegias, Pinks, Primroses, Erica, Silenes, Scabious, Pansies, Violets, Gentians, Anemones, etc.). 10 gr. 2 fr. 50.
